Chapter 5

Normalization of Database Tables

Database Systems:
Design, Implementation, and Management,
Sixth Edition, Rob and Coronel

In this chapter, you will learn:

- What normalization is and what role it plays in the database design process
- About the normal forms 1NF, 2NF, 3NF, BCNF, and 4NF
- How normal forms can be transformed from lower normal forms to higher normal forms
- That normalization and ER modeling are used concurrently to produce a good database design
- That some situations require denormalization to generate information efficiently

Database Tables and Normalization

- Normalization
 - Process for evaluating and correcting table structures to minimize data redundancies
 - helps eliminate data anomalies
 - Works through a series of stages called normal forms:
 - Normal form (1NF)
 - Second normal form (2NF)
 - Third normal form (3NF)

Database Tables and Normalization (continued)

- 2NF is better than 1NF; 3NF is better than 2NF
- For most business database design purposes,
 3NF is highest we need to go in the normalization process
- Highest level of normalization is not always most desirable

The Need for Normalization

- Example: company that manages building projects
 - Charges its clients by billing hours spent on each contract
 - Hourly billing rate is dependent on employee's position
 - Periodically, a report is generated that contains information displayed in Table 5.1

A Sample Report Layout

TABLE 5.1 A SAMPLE REPORT LAYOUT

PROJ. NUM.	PROJECT NAME	EMPLOYEE NUMBER	EMPLOYEE NAME	JOB CLASS.	CHG/HOUR	HOURS BILLED	TOTAL CHARGE

The Need for Normalization (continued)

- Structure of data set in Figure 5.1 does not handle data very well
- The table structure appears to work; report is generated with ease
- Unfortunately, the report may yield different results, depending on what data anomaly has occurred

Conversion to First Normal Form

Repeating group

- Derives its name from the fact that a group of multiple (related) entries can exist for any single key attribute occurrence
- Relational table must not contain repeating groups
- Normalizing the table structure will reduce these data redundancies
- Normalization is three-step procedure

Step 1: Eliminate the Repeating Groups

- Present data in a tabular format, where each cell has a single value and there are no repeating groups
- Eliminate repeating groups by eliminating nulls, making sure that each repeating group attribute contains an appropriate data value

Data Organization: First Normal Form

FIGURE 5.2 DATA ORGANIZATION: FIRST NORMAL FORM

25	Starflight	112	Darlene M. Smithson	DSS Analyst	\$45.95	41

Step 2: Identify the Primary Key

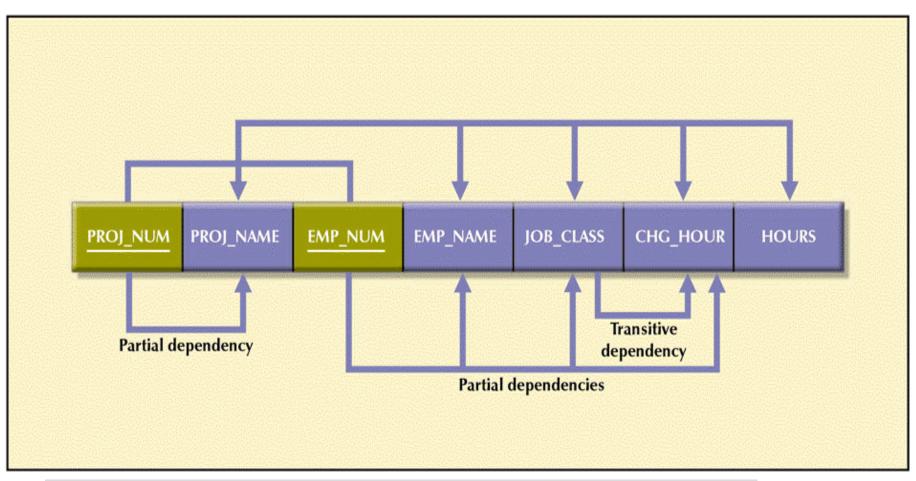

- Primary key must uniquely identify attribute value
- New key must be composed

Step 3: Identify all Dependencies

- Dependencies can be depicted with the help of a diagram
- Dependency diagram:
 - Depicts all dependencies found within a given table structure
 - Helpful in getting bird's-eye view of all relationships among a table's attributes
 - Use makes it much less likely that an important dependency will be overlooked

A Dependency Diagram: First Normal Form (1NF)

FIGURE 5.3 A DEPENDENCY DIAGRAM: FIRST NORMAL FORM (1NF)

First Normal Form

- Tabular format in which:
 - All key attributes are defined
 - There are no repeating groups in the table
 - All attributes are dependent on primary key
- All relational tables satisfy 1NF requirements
- Some tables contain partial dependencies
 - Dependencies based on only part of the primary key
 - Sometimes used for performance reasons, but should be used with caution
 - Still subject to data redundancies

Conversion to Second Normal Form

- Relational database design can be improved by converting the database into second normal form (2NF)
- Two steps

Step 1: Identify All Key Components

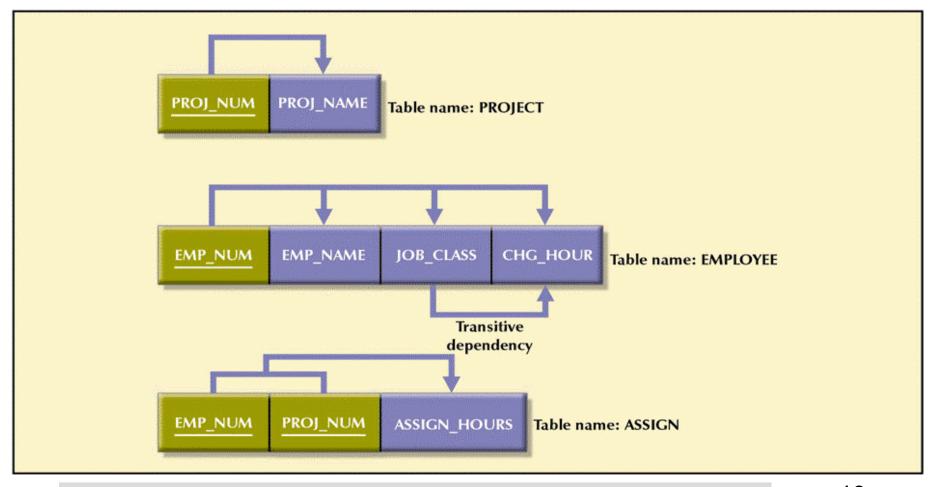

- Write each key component on separate line, and then write the original (composite) key on the last line
- Each component will become the key in a new table

Step 2: Identify the Dependent Attributes

- Determine which attributes are dependent on which other attributes
- At this point, most anomalies have been eliminated

Second Normal Form (2NF) Conversion Results

FIGURE 5.4 SECOND NORMAL FORM (2NF) CONVERSION RESULTS

Second Normal Form

- Table is in second normal form (2NF) if:
 - It is in 1NF and
 - It includes no partial dependencies:
 - No attribute is dependent on only a portion of the primary key

Conversion to Third Normal Form

 Data anomalies created are easily eliminated by completing three steps

Step 1: Identify Each New Determinant

 For every transitive dependency, write its determinant as a PK for a new table

Determinant

Any attribute whose value determines other values within a row

Step 2: Identify the Dependent Attributes

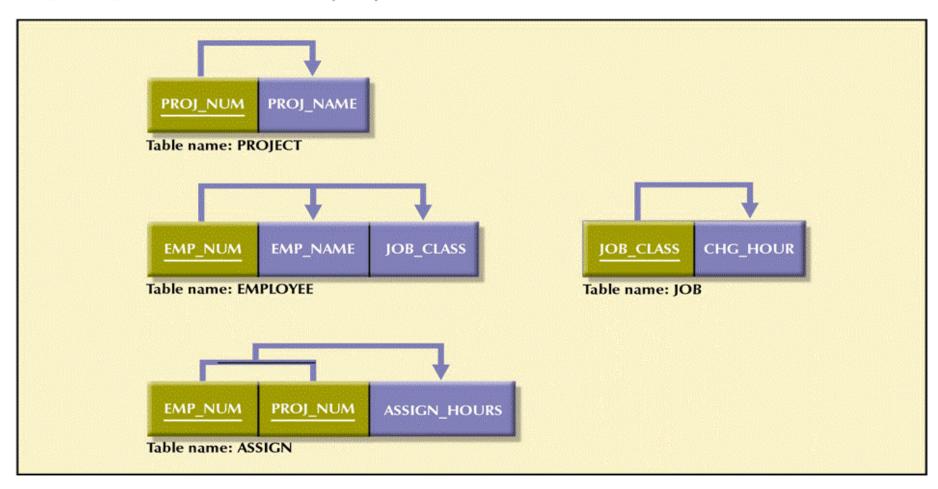

- Identify the attributes dependent on each determinant identified in Step 1 and identify the dependency
- Name the table to reflect its contents and function

Step 3: Remove the Dependent Attributes from Transitive Dependencies

- Eliminate all dependent attributes in transitive relationship(s) from each table that has such a transitive relationship
- Draw a new dependency diagram to show all tables defined in Steps 1–3
- Check new tables and modified tables from Step 3 to make sure that each has a determinant and does not contain inappropriate dependencies

Third Normal Form (3NF) Conversion Results

FIGURE 5.5 THIRD NORMAL FORM (3NF) CONVERSION RESULTS

Third Normal Form

- A table is in third normal form (3NF) if:
 - It is in 2NF and
 - It contains no transitive dependencies

Improving the Design

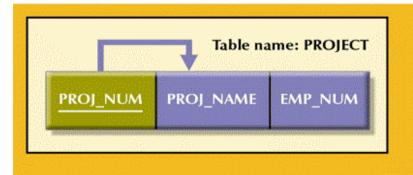

- Table structures are cleaned up to eliminate the troublesome initial partial and transitive dependencies
- Normalization cannot, by itself, be relied on to make good designs
- It is valuable because its use helps eliminate data redundancies

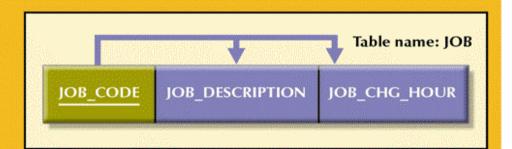

Improving the Design (continued)

- The following changes were made:
 - PK assignment
 - Naming conventions
 - Attribute atomicity
 - Adding attributes
 - Adding relationships
 - Refining PKs
 - Maintaining historical accuracy
 - Using derived attributes

The Completed Database

The Completed Database (continued)

FIGURE 5.6 THE COMPLETED DATABASE (CONTINUED)

Limitations on System-Assigned Keys

- System-assigned primary key may not prevent confusing entries
- Data entries in Table 5.2 are inappropriate because they duplicate existing records
 - Yet there has been no violation of either entity integrity or referential integrity

Duplicate Entries in the JOB Table

TABLE 5.2 DUPLICATE ENTRIES IN THE JOB TABLE

JOB_CODE	JOB_DESCRIPTION	JOB_CHG_HOUR
511	Programmer	\$35.75
512	Programmer	\$35.75

The Boyce-Codd Normal Form (BCNF)

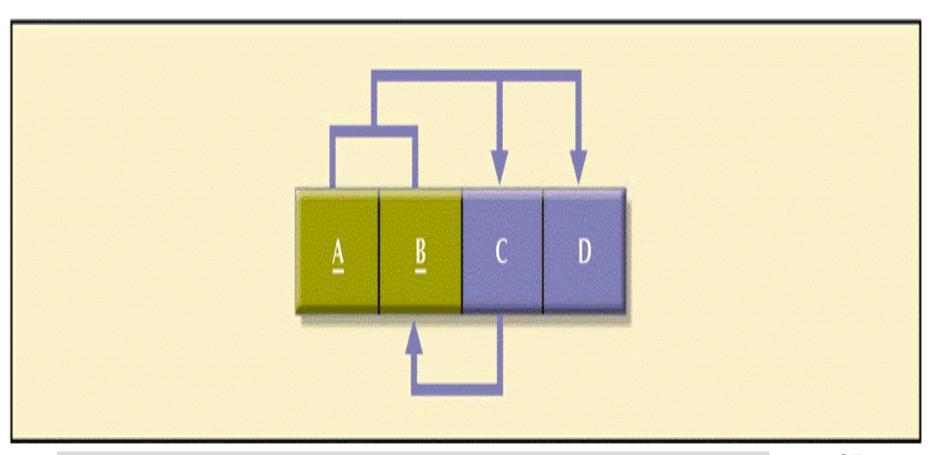

- Every determinant in the table is a candidate key
 - Has same characteristics as primary key, but for some reason, not chosen to be primary key
- If a table contains only one candidate key, the 3NF and the BCNF are equivalent
- BCNF can be violated only if the table contains more than one candidate key

The Boyce-Codd Normal Form (BCNF) (continued)

- Most designers consider the Boyce-Codd normal form (BCNF) as a special case of 3NF
- A table is in 3NF if it is in 2NF and there are no transitive dependencies
- A table can be in 3NF and not be in BCNF
 - A transitive dependency exists when one nonprime attribute is dependent on another nonprime attribute
 - A nonkey attribute is the determinant of a key attribute

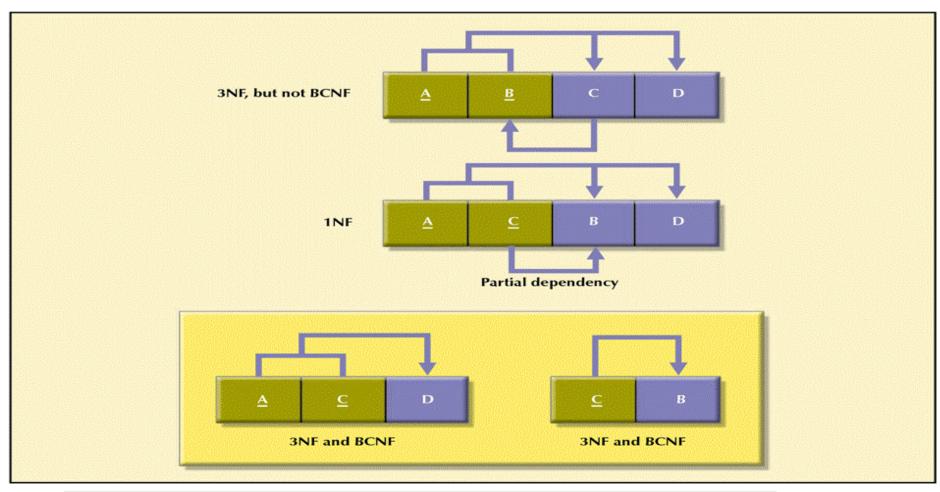

A Table That is in 3NF but not in BCNF

FIGURE 5.7 A TABLE THAT IS IN 3NF BUT NOT IN BCNF

144	20	32456	В

Another BCNF Decomposition

FIGURE 5.9 ANOTHER BCNF DECOMPOSITION

Normalization and Database Design

- Normalization should be part of design process
- Make sure that proposed entities meet required normal form before table structures are created
- Many real-world databases have been improperly designed or burdened with anomalies if improperly modified during course of time
- You may be asked to redesign and modify existing databases

Normalization and Database Design (continued)

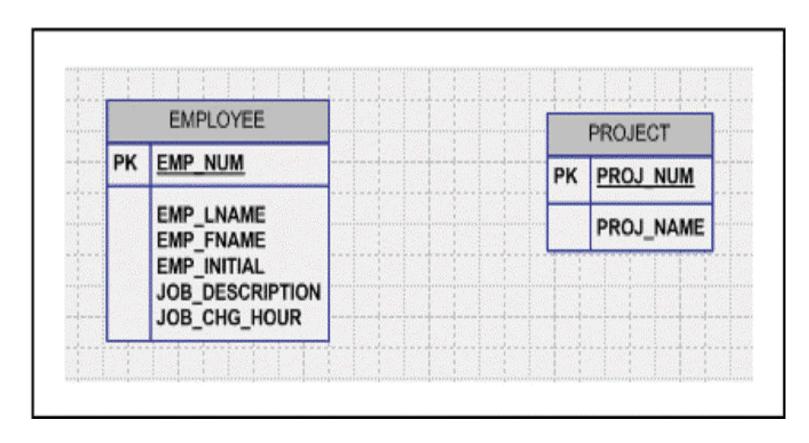

- ER diagram
 - Provides the big picture, or macro view, of an organization's data requirements and operations
 - Created through an iterative process
 - Identifying relevant entities, their attributes and their relationship
 - Use results to identify additional entities and attributes

Normalization and Database Design (continued)

- Normalization procedures
 - Focus on the characteristics of specific entities
 - A micro view of the entities within the ER diagram
- Difficult to separate normalization process from ER modeling process
- Two techniques should be used concurrently

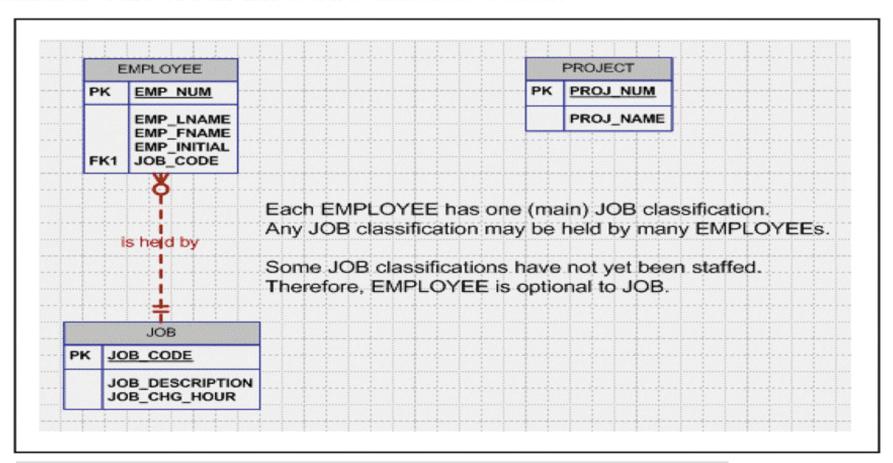

The Initial ERD for a Contracting Company

Higher-Level Normal Forms

In some databases, multiple multivalued attributes exist

Tables with Multivalued Dependencies

Fourth Normal Form

- Table is in fourth normal form (4NF) if
 - It is in 3NF
 - Has no multiple sets of multivalued dependencies
- 4NF is largely academic if tables conform to the following two rules:
 - All attributes are dependent on primary key but independent of each other
 - No row contains two or more multivalued facts about an entity

A Set of Tables in 4NF

FIGURE 5.16 A SET OF TABLES IN 4NF

Denormalization

- Creation of normalized relations is important database design goal
- Processing requirements should also be a goal
- If tables decomposed to conform to normalization requirements
 - Number of database tables expands

Denormalization (continued)

- Joining larger number of tables takes additional disk input/output (I/O) operations and processing logic
 - Reduces system speed
- Conflicts among design efficiency, information requirements, and processing speed are often resolved through compromises that may include denormalization

Denormalization (continued)

- Unnormalized tables in a production database tend to have these defects:
 - Data updates are less efficient because programs that read and update tables must deal with larger tables
 - Indexing is much more cumbersome
 - Unnormalized tables yield no simple strategies for creating virtual tables known as views

Denormalization (continued)

- Use denormalization cautiously
- Understand why—under some circumstances unnormalized tables are a better choice

Summary

- Normalization is a table design technique aimed at minimizing data redundancies
- First three normal forms (1NF, 2NF, and 3NF) are most commonly encountered
- Normalization is an important part—but only a part—of the design process
- Continue the iterative ER process until all entities and their attributes are defined and all equivalent tables are in 3NF

Summary (continued)

- A table in 3NF may contain multivalued dependencies that produce either numerous null values or redundant data
- It may be necessary to convert a 3NF table to the fourth normal form (4NF) by
 - splitting such a table to remove multivalued dependencies
- Tables are sometimes denormalized to yield less I/O which increases processing speed
